**On the existence of attractors for stochastic functional semilinear equations
without uniqueness of solutions**

(In collaboration with: T. Caraballo, B. Schmalfuss and J. Valero)

Keywords: Multivalued non-autonomous and random dynamical systems, pullback and random attractors, functional stochastic equations

Abstract: In this talk we investigate the asymptotic behaviour of random and stochastic evolution equations with infinite delays when uniqueness of solutions for these equations is not required. In particular we study the existence and uniqueness of pullback and random attractors associated to multivalued non-autonomous and random dynamical systems, which are generated by the globally defined solutions to our random and stochastic equations.
