# On the Continuous Dependence on a Parameter of Solutions of IVP's for Linear GDE's 

Milan Tvrdý *

Mathematical Institute<br>Academy of Sciences of the Czech Republic 11567 PRAHA 1, Žitná 25, Czech Republic<br>(e-mail: tvrdy@math.cas.cz)

#### Abstract

In the contribution the continuous dependence of solutions to linear generalized differential equations ( $G D E$ 's) of the form

$$
x(t)=x(0)+\int_{0}^{t} \mathrm{~d}\left[A_{k}(s)\right] x(s), \quad t \in[0,1]
$$

on a parameter $k \in \mathbf{N}$ is discussed.
Keywords. Generalized linear differential equation, correctness, continuous dependence on a parameter, Perron-Stieltjes integral, Kurzweil-Henstock integral.

AMS Subject Classification. 34A37, 45A05, 34A30.

## 1. Introduction

Throughout the paper $\mathbf{N}$ stands for the set of positive integers. Furthermore, $\mathbf{R}^{n \times m}$ denotes the space of real $n \times m$-matrices, $\mathbf{R}^{n}=\mathbf{R}^{n \times 1}, \mathbf{R}^{1}=\mathbf{R}$. For a given $n \times m$ matrix $A \in \mathbf{R}^{n \times m}$, by $|A|$ we denote its norm,

$$
|A|=\max _{i=1, \ldots, n} \sum_{j=1}^{m}\left|a_{i, j}\right|
$$

and det $A$ is its determinant. The symbols I and 0 stand respectively for the identity and the zero matrix of the proper type.

[^0]As usual, by $[0,1]$ and $(0,1)$ we denote the corresponding closed and open intervals, respectively. Furthermore, $[0,1)$ and $(0,1]$ are the corresponding half-open intervals.

The space of all functions $F:[0,1] \rightarrow \mathbf{R}^{n \times m}$ of bounded variation on $[0,1]$ is denoted by $\mathbf{B V}^{n \times m}$. It is well known that $\mathbf{B V}{ }^{n \times m}$ equipped with the norm

$$
F \in \mathbf{B V}^{n \times m} \rightarrow\|F\|_{\mathbf{B V}}=|F(0)|+\operatorname{var}_{0}^{1} F
$$

is a Banach space. For a given $F \in \mathbf{B V}^{n \times m}$, we denote

$$
\begin{gathered}
F(t-)=\lim _{\tau \rightarrow t-} F(\tau) \text { and } \Delta^{-} F(t)=F(t)-F(t-) \text { for } t \in(0,1], \\
F(t+)=\lim _{\tau \rightarrow t+} F(\tau) \text { and } \Delta^{+} F(t)=F(t+)-F(t) \text { for } t \in[0,1), \\
F(0-)=F(0), \Delta^{-} F(0)=0, F(1+)=F(1), \Delta^{+} F(1)=0 .
\end{gathered}
$$

As usual, the space of $n \times m$-matrix valued functions continuous on $[0,1]$ is denoted by $\mathbf{C}^{n \times m}$ and the space of $n \times m$-matrix valued functions Lebesgue integrable on $[0,1]$ is denoted by $\mathbf{L}_{1}^{n \times m}$. Instead of $\mathbf{B V}^{n \times 1}$ or $\mathbf{C}^{n \times 1}$ or $\mathbf{L}_{1}^{n \times 1}$ we write $\mathbf{B V}^{n}$ or $\mathbf{C}^{n}$ or $\mathbf{L}_{1}^{n}$, respectively. For given $F \in \mathbf{L}_{1}^{n \times m}$ and $G \in \mathbf{C}^{n \times m}$, we denote

$$
\|F\|_{\mathbf{L}_{1}}=\int_{0}^{1}|F(t)| \mathrm{d} t \quad \text { and } \quad\|G\|=\sup _{t \in[0,1]}|G(t)| .
$$

The integrals are considered in the Perron-Stieltjes sense. We work with the equivalent summation definition due to J. Kurzweil (cf. [5]) which is now usually called the Kurzweil - Henstock integral or the gauge integral.

Let $P_{k} \in \mathbf{L}_{1}^{n \times n}$ for $k \in \mathbf{N} \cup\{0\}$ and let $X_{k} \in \mathbf{A C}^{n \times n}$ be the corresponding fundamental matrices, i.e.

$$
X_{k}(t)=\mathrm{I}+\int_{0}^{t} P_{k}(s) X_{k}(s) \mathrm{d} s \quad \text { on } \quad[0,1] \quad \text { for } \quad k \in \mathbf{N} \cup\{0\} .
$$

The following two assertions are relatively representative examples of theorems on the continuous dependence of solutions of ordinary differential equations on a parameter.

### 1.1. Theorem. If

$$
\lim _{k \rightarrow \infty} \int_{0}^{1}\left|P_{k}(s)-P_{0}(s)\right| \mathrm{d} s=0
$$

then

$$
\lim _{k \rightarrow \infty} X_{k}(t)=X_{0}(t) \quad \text { uniformly on }[0,1] .
$$

1.2. Theorem. (Kurzweil \& Vorel, [6]) Let there exist $m \in \mathbf{L}_{1}^{1}$ such that

$$
\begin{equation*}
\left|P_{k}(t)\right| \leq m(t) \quad \text { a.e. on } \quad[0,1] \quad \text { for all } k \in \mathbf{N} \tag{1.1}
\end{equation*}
$$

and let

$$
\begin{equation*}
\lim _{k \rightarrow \infty} \int_{0}^{t} P_{k}(s) \mathrm{d} s=\int_{0}^{t} P_{0}(s) \mathrm{d} s \quad \text { uniformly on }[0,1] . \tag{1.2}
\end{equation*}
$$

Then

$$
\lim _{k \rightarrow \infty} X_{k}(t)=X_{0}(t) \quad \text { uniformly on }[0,1] .
$$

1.3. Remark. For $t \in[0,1]$ and $k \in \mathbf{N} \cup\{0\}$ denote

$$
A_{k}(t)=\int_{0}^{t} P_{k}(s) \mathrm{d} s
$$

Then the assumptions of Theorem 1.2 may be reformulated for $A_{k}$ as follows:

$$
\begin{align*}
& A_{k} \in \mathbf{A} \mathbf{C}^{n \times n} \quad \text { for all } k \in \mathbf{N} \cup\{0\}  \tag{1.3}\\
& \sup _{k \in \mathbf{N}}\left\|A_{k}^{\prime}\right\|_{\mathbf{L}_{1}}<\infty  \tag{1.4}\\
& \lim _{k \rightarrow \infty} A_{k}(t)=A_{0}(t) \quad \text { uniformly on }[0,1] . \tag{1.5}
\end{align*}
$$

Besides, the assumption (1.1) means that there exists a nondecreasing function $h_{0} \in \mathbf{A C}$ such that

$$
\left|A_{k}\left(t_{2}\right)-A_{k}\left(t_{1}\right)\right| \leq\left|h_{0}\left(t_{2}\right)-h_{0}\left(t_{1}\right)\right| \quad \text { for all } \quad t_{1}, t_{2} \in[0,1] .
$$

In fact, we may put

$$
h_{0}(t)=\int_{0}^{t} m(s) \mathrm{d} s \quad \text { on }[0,1] .
$$

## 2. Linear GDE's - a survey of known results

The following basic existence result for linear generalized differential equations of the form

$$
x(t)=\widetilde{x}+\int_{0}^{t} \mathrm{~d}[A(s)] x(s), \quad t \in[0,1]
$$

may be found e.g. in [9] (cf. Theorem III.1.4) or in [8] (cf. Theorem 6.13).
2.1. Theorem. Let $A \in \mathbf{B V}^{n \times n}$ be such that

$$
\begin{equation*}
\operatorname{det}\left[\mathrm{I}-\Delta^{-} A(t)\right] \neq 0 \quad \text { for all } t \in(0,1] . \tag{2.1}
\end{equation*}
$$

Then there exists a unique $X \in \mathbf{B V}^{n \times n}$ such that

$$
\begin{equation*}
X(t)=\mathrm{I}+\int_{0}^{t} \mathrm{~d}[A(s)] X(s) \quad \text { on } \quad[0,1] . \tag{2.2}
\end{equation*}
$$

2.2. Definition. For a given $A \in \mathbf{B V}^{n \times n}$, the $n \times n$-matrix valued function $X \in$ $\mathbf{B V}^{n \times n}$ such that (2.2) holds is called the fundamental matrix corresponding to $A$.

When restricted to the linear case, Theorem 8.8 from [8] modifies to
2.3. Theorem. Let $A_{0} \in \mathrm{BV}^{n \times n}$ satisfy (2.1) and let $X_{0}$ be the corresponding fundamental matrix. Let $A_{k} \in \mathbf{B V}^{n \times n}, k \in \mathbf{N}$, and scalar nondecreasing and leftcontinuous on $(0,1]$ functions $h_{k}, k \in \mathbf{N} \cup\{0\}$, be given such that $h_{0}$ is continuous on $[0,1]$ and

$$
\begin{align*}
& \lim _{k \rightarrow \infty} A_{k}(t)=A_{0}(t) \quad \text { on } \quad[0,1]  \tag{2.3}\\
& \left|A_{k}\left(t_{2}\right)-A_{k}\left(t_{1}\right)\right| \leq\left|h_{k}\left(t_{2}\right)-h_{k}\left(t_{1}\right)\right|  \tag{2.4}\\
& \quad \text { for all } t_{1}, t_{2} \in[0,1] \text { and } k \in \mathbf{N} \cup\{0\}, \\
& \limsup _{k \rightarrow \infty}\left[h_{k}\left(t_{2}\right)-h_{k}\left(t_{1}\right)\right] \leq h_{0}\left(t_{2}\right)-h_{0}\left(t_{1}\right)  \tag{2.5}\\
& \quad \text { whenever } 0 \leq t_{1} \leq t_{2} \leq 1
\end{align*}
$$

Then for any $k \in \mathbf{N}$ sufficiently large there exists a fundamental matrix $X_{k}$ corresponding to $A_{k}$ and

$$
\lim _{k \rightarrow \infty} X_{k}(t)=X_{0}(t) \quad \text { uniformly on }[0,1] .
$$

2.4. Lemma. Under the assumptions of Theorem 2.3 we have

$$
\begin{equation*}
\sup _{k \in \mathbf{N}} \operatorname{var}_{0}^{1} A_{k}<\infty \tag{2.6}
\end{equation*}
$$

and

$$
\begin{equation*}
\lim _{k \rightarrow \infty}\left[A_{k}(t)-A_{k}(0)\right]=A_{0}(t)-A_{0}(0) \text { uniformly on }[0,1] . \tag{2.7}
\end{equation*}
$$

Proof. ${ }^{1}$ i) By (2.5) there is $k_{0} \in \mathbf{N}$ such that

$$
h_{k}(1)-h_{k}(0) \leq h_{0}(1)-h_{0}(0)+1 \quad \text { for all } k \geq k_{0} .
$$

Hence for any $k \in \mathbf{N}$ we have

$$
\operatorname{var}_{0}^{1} A_{k} \leq \alpha_{0}=\max \left(\left\{\operatorname{var}_{0}^{1} A_{k} ; k \leq k_{0}\right\} \cup\left\{h_{0}(1)-h_{0}(0)+1\right\}\right)<\infty .
$$

Thus we conclude that (2.6) is true.
ii) Suppose that

$$
\begin{equation*}
\lim _{k \rightarrow \infty} A_{k}(t)=A_{0}(t) \quad \text { uniformly on }[0,1] \tag{2.8}
\end{equation*}
$$

is not valid. Then there is $\widetilde{\varepsilon}>0$ such that for any $\ell \in \mathbf{N}$ there exist $m_{\ell} \geq \ell$ and $t_{\ell} \in[0,1]$ such that

$$
\begin{equation*}
\left|A_{m_{\ell}}\left(t_{\ell}\right)-A_{0}\left(t_{\ell}\right)\right| \geq \widetilde{\varepsilon} . \tag{2.9}
\end{equation*}
$$

We may assume that $m_{\ell+1}>m_{\ell}$ for any $\ell \in \mathbf{N}$ and

$$
\begin{equation*}
\lim _{\ell \rightarrow \infty} t_{\ell}=t_{0} \in[0,1] . \tag{2.10}
\end{equation*}
$$

Let $t_{0} \in(0,1)$ and let an arbitrary $\varepsilon>0$ be given. Since $h_{0}$ is continuous, we may choose $\eta>0$ in such a way that $t_{0}-\eta, t_{0}+\eta \in[0,1]$ and

$$
\begin{equation*}
h_{0}\left(t_{0}+\eta\right)-h_{0}\left(t_{0}-\eta\right)<\varepsilon . \tag{2.11}
\end{equation*}
$$

Furthermore, by (2.3) there is $\ell_{1} \in \mathbf{N}$ such that

$$
\begin{equation*}
\left|A_{m_{\ell}}\left(t_{0}\right)-A_{0}\left(t_{0}\right)\right|<\varepsilon \quad \text { for all } \ell \geq \ell_{1} \tag{2.12}
\end{equation*}
$$

and by (2.4), (2.5) and (2.11) there is $\ell_{2} \in \mathbf{N}, \ell_{2} \geq \ell_{1}$, such that

$$
\begin{align*}
\left|A_{m_{\ell}}\left(\tau_{2}\right)-A_{m_{\ell}}\left(\tau_{1}\right)\right| & \leq h_{0}\left(t_{0}+\eta\right)-h_{0}\left(t_{0}-\eta\right)+\varepsilon<2 \varepsilon  \tag{2.13}\\
& \text { whenever } \tau_{1}, \tau_{2} \in\left(t_{0}-\eta, t_{0}+\eta\right) \text { and } \ell \geq \ell_{2} .
\end{align*}
$$

The relations (2.3) and (2.13) imply immediately that

$$
\begin{array}{r}
\left|A_{0}\left(\tau_{2}\right)-A_{0}\left(\tau_{1}\right)\right|=\lim _{\ell \rightarrow \infty}\left|A_{m_{\ell}}\left(\tau_{2}\right)-A_{m_{\ell}}\left(\tau_{1}\right)\right| \leq 2 \varepsilon  \tag{2.14}\\
\text { whenever } \tau_{1}, \tau_{2} \in\left(t_{0}-\eta, t_{0}+\eta\right) .
\end{array}
$$

[^1]Finally, let $\ell_{3} \in \mathbf{N}$ be such that $\ell_{3} \geq \ell_{2}$ and

$$
\begin{equation*}
\left|t_{\ell}-t_{0}\right|<\eta \quad \text { for all } \quad \ell \geq \ell_{3} \tag{2.15}
\end{equation*}
$$

then in virtue of the relations (2.10)-(2.15) we have

$$
\begin{aligned}
& \left|A_{m_{\ell}}\left(t_{\ell}\right)-A_{0}\left(t_{\ell}\right)\right| \\
& \quad \leq\left|A_{m_{\ell}}\left(t_{\ell}\right)-A_{m_{\ell}}\left(t_{0}\right)\right|+\left|A_{m_{\ell}}\left(t_{0}\right)-A_{0}\left(t_{0}\right)\right|+\left|A_{0}\left(t_{0}\right)-A_{0}\left(t_{\ell}\right)\right| \\
& \quad \leq 5 \varepsilon
\end{aligned}
$$

Hence, choosing $\varepsilon<\frac{1}{5} \widetilde{\varepsilon}$, we obtain by (2.9) that

$$
\widetilde{\varepsilon}>\left|A_{m_{\ell}}\left(t_{\ell}\right)-A_{0}\left(t_{\ell}\right)\right| \geq \widetilde{\varepsilon}
$$

This being impossible, the relation (2.8) has to be true. The modification of the proof in the cases $t_{0}=0$ or $t_{0}=1$ and the extension of (2.8) to (2.7) is obvious.

Thus, Theorem 2.3 is a special case of the following result due to M. Ashordia (cf.[1]).
2.5. Theorem. Let $A_{0} \in \mathbf{B V}^{n \times n}$ satisfy (2.1), let $X_{0}$ be the corresponding fundamental matrix and let $\left\{A_{k}\right\}_{k=1}^{\infty} \subset \mathbf{B V}^{n \times n}$ be such that (2.6) and (2.7) hold. Then for any $k \in \mathbf{N}$ sufficiently large there exists a fundamental matrix $X_{k}$ corresponding to $A_{k}$ and

$$
\lim _{k \rightarrow \infty} X_{k}(t)=X_{0}(t) \quad \text { uniformly on }[0,1] .
$$

2.6. Remark. Under the assumptions of Theorem 2.5 we obviously have

$$
\lim _{k \rightarrow \infty} A_{k}(t-)=A_{0}(t-) \text { and } \lim _{k \rightarrow \infty} A_{k}(s+)=A_{0}(s+)
$$

for all $t \in(0,1]$ and all $s \in[0,1)$, respectively. Thus Theorem 2.5 cannot cover the case that there is a $t_{0} \in(0,1]$ such that

$$
A_{k}\left(t_{0}-\right)=A_{k}\left(t_{0}\right) \quad \text { for all } k \in \mathbf{N}, \quad \text { while } \quad A_{0}\left(t_{0}-\right) \neq A_{0}\left(t_{0}\right) .
$$

In particular, Theorem 2.5 does not apply to the following simple example.
2.7. Example. Consider the sequence of initial value problems

$$
x_{k}^{\prime}=a_{k}^{\prime}(t) x_{k} \quad \text { on }[-1,1], \quad x(-1)=\widetilde{x}
$$

where

$$
a_{k}(t)=\left\{\begin{array}{cl}
0 & \text { if } t \leq \alpha_{k} \\
\frac{t-\alpha_{k}}{\beta_{k}-\alpha_{k}} & \text { if } t \in\left(\alpha_{k}, \beta_{k}\right) \\
1 & \text { if } t \geq \beta_{k}
\end{array}\right.
$$

$\left\{\alpha_{k}\right\}_{k=1}^{\infty}$ is an arbitrary increasing sequence in $[-1,0)$ such that

$$
\lim _{k \rightarrow \infty} \alpha_{k}=0
$$

$\left\{\beta_{k}\right\}_{k=1}^{\infty}$ is an arbitrary decreasing sequence in $(0,1]$ such that

$$
\lim _{k \rightarrow \infty} \beta_{k}=0
$$

and

$$
\lim _{k \rightarrow \infty} \frac{\alpha_{k}}{\alpha_{k}-\beta_{k}}=\varkappa \in[0,1)
$$

For the corresponding solutions we have

$$
\begin{gathered}
x_{k}(t)=\left\{\begin{array}{cl}
\widetilde{x} & \text { if } t \leq \alpha_{k}, \\
\mathrm{e}^{\frac{t-\alpha_{k}}{\beta_{k}-\alpha_{k}}} \widetilde{x} & \text { if } t \in\left(\alpha_{k}, \beta_{k}\right), \\
\mathrm{e} \widetilde{x} & \text { if } t \geq \beta_{k}
\end{array}\right. \\
x_{0}(t)=\lim _{k \rightarrow \infty} x_{k}(t)=\left\{\begin{array}{cc}
\widetilde{x} & \text { if } t<0, \\
\mathrm{e}^{\varkappa} \widetilde{x} & \text { if } t=0, \\
\mathrm{e} \widetilde{x} & \text { if } t>0,
\end{array}\right.
\end{gathered}
$$

while the unique solution $x(t)$ of the "limit" equation

$$
x(t)=\widetilde{x}+\int_{-1}^{t} \mathrm{~d}[a(s)] x(s), \quad t \in[-1,1]
$$

where

$$
a(t)=\lim _{k \rightarrow \infty} a_{k}(t)= \begin{cases}0 & \text { if } t<0 \\ \varkappa & \text { if } t=0 \\ 1 & \text { if } t>0\end{cases}
$$

is given by

$$
x(t)=\left\{\begin{array}{cl}
\widetilde{x} & \text { if } t<0 \\
\frac{1}{1-\varkappa} \widetilde{x} & \text { if } t=0 \\
\frac{2-\varkappa}{1-\varkappa} \widetilde{x} & \text { if } t>0
\end{array}\right\} \neq x_{0}(t)
$$

On the other hand, $x_{0}$ is a solution to

$$
x_{0}(t)=\widetilde{x}+\int_{-1}^{t} \mathrm{~d}\left[a_{0}(t)\right] x_{0}(s) \quad \text { on } \quad[-1,1]
$$

where

$$
a_{0}(t)=\left\{\begin{array}{cl}
0 & \text { if } t<0 \\
1-\mathrm{e}^{-\varkappa} & \text { if } t=0 \\
(\mathrm{e}-1) \mathrm{e}^{-\varkappa} & \text { if } t>0
\end{array}\right.
$$

and $a_{k}$ tends to $a_{0}$ in the following sense:
(a) given arbitrary $\alpha \in(-1,0)$ and $\beta \in(0,1), \lim _{k \rightarrow \infty} a_{k}(t)=a_{0}(t)$ uniformly on $[-1, \alpha]$ and $\lim _{k \rightarrow \infty}\left[a_{k}(t)-a_{k}(\beta)\right]=a_{0}(t)-a_{0}(\beta)$ uniformly on $[\beta, 1] ;$
(b) $\lim _{k \rightarrow \infty} a_{k}(t)=a_{0}(t)+\widetilde{a_{0}}(t)$, where

$$
\widetilde{a_{0}}(t)=\left\{\begin{array}{cc}
0 & \text { if } t<0 \\
\varkappa+\mathrm{e}^{-\varkappa}-1 & \text { if } t=0 \\
1-\mathrm{e}^{1-\varkappa}+\mathrm{e}^{-\varkappa} & \text { if } t>0
\end{array}\right.
$$

(c) for any $z \in \mathbf{R}$ and $\varepsilon>0$, there is $\delta>0$ such that for any $\delta^{\prime} \in(0, \delta)$ there is $k_{0} \in \mathbf{N}$ such that for any $k \geq k_{0}$ we have $\alpha_{k} \geq-\delta^{\prime}, \beta_{k} \leq \delta^{\prime}$ and the relations

$$
\left|y_{k}(0)-y_{k}\left(-\delta^{\prime}\right)-\frac{\Delta^{-} a_{0}(0) z}{1-\Delta^{-} a_{0}(0)}\right|<\varepsilon
$$

and

$$
\left|z_{k}\left(\delta^{\prime}\right)-z_{k}(0)-\Delta^{+} a_{0}(0) z\right|<\varepsilon
$$

are satisfied for any solution $y_{k}$ on $\left[-\delta^{\prime}, 0\right]$ of

$$
y_{k}^{\prime}=a_{k}^{\prime}(t) y_{k} \quad \text { with } \quad y_{k}\left(-\delta^{\prime}\right) \in(z-\delta, z+\delta)
$$

and any solution $z_{k}$ on $\left[0, \delta^{\prime}\right]$ of

$$
z_{k}^{\prime}=a_{k}^{\prime}(t) z_{k} \quad \text { with } \quad z_{k}(0) \in(z-\delta, z+\delta)
$$

In fact, for given $z \in \mathbf{R}, \delta^{\prime}>0$ and $k \in \mathbf{N}$ such that $\alpha_{k} \geq-\delta^{\prime}$ we have

$$
y_{k}(t)=\mathrm{e}^{\frac{t-\alpha_{k}}{\beta_{k}-\alpha_{k}}} y_{k}\left(-\delta^{\prime}\right) \quad \text { on } \quad\left[\alpha_{k}, 0\right]
$$

and thus

$$
\begin{aligned}
\mid y_{k}(0) & \left.-y_{k}\left(-\delta^{\prime}\right)-\frac{\Delta^{-} a_{0}(0) z}{1-\Delta^{-} a_{0}(0)} \right\rvert\, \\
& =\left|\left(\mathrm{e}^{\frac{-\alpha_{k}}{\beta_{k}-\alpha_{k}}}-1\right) y_{k}\left(-\delta^{\prime}\right)-\left(\mathrm{e}^{\varkappa}-1\right) z\right| \\
& \leq\left|\mathrm{e}^{\frac{-\alpha_{k}}{\beta_{k}-\alpha_{k}}}-\mathrm{e}^{\chi}\right||z|+\left|\mathrm{e}^{\frac{-\alpha_{k}}{\beta_{k}-\alpha_{k}}}-1\right|\left|z-y_{k}\left(-\delta^{\prime}\right)\right|,
\end{aligned}
$$

where

$$
\lim _{k \rightarrow \infty}\left|\mathrm{e}^{\frac{-\alpha_{k}}{\beta_{k}-\alpha_{k}}}-\mathrm{e}^{\varkappa}\right|=0, \quad\left|\mathrm{e}^{\frac{-\alpha_{k}}{\beta_{k}-\alpha_{k}}}-1\right| \leq 2
$$

and

$$
\left|z-y_{k}\left(-\delta^{\prime}\right)\right| \leq \delta .
$$

Analogously, if $k \in \mathbf{N}$ is such that $\beta_{k} \leq \delta^{\prime}$, we have

$$
z_{k}(t)=\mathrm{e}^{\frac{\beta_{k}}{\beta_{k}-\alpha_{k}}} z_{k}(0) \quad \text { on } \quad\left[0, \delta^{\prime}\right]
$$

and thus

$$
\begin{aligned}
\mid z_{k}\left(\delta^{\prime}\right) & -z_{k}(0)-\Delta^{+} a_{0}(0) z \mid \\
& =\left|\left(\mathrm{e}^{\frac{\beta_{k}}{\beta_{k}-\alpha_{k}}}-1\right) z_{k}\left(-\delta^{\prime}\right)-\left(\mathrm{e}^{1-\varkappa}-1\right) z\right| \\
& \leq\left|\mathrm{e}^{\frac{\beta_{k}}{\beta_{k}-\alpha_{k}}}-\mathrm{e}^{1-\varkappa}\right||z|+\left|\mathrm{e}^{\frac{\beta_{k}}{\beta_{k}-\alpha_{k}}}-1\right|\left|z-z_{k}(0)\right|,
\end{aligned}
$$

where

$$
\lim _{k \rightarrow \infty}\left|e^{\frac{\beta_{k}}{\beta_{k}-\alpha_{k}}}-\mathrm{e}^{1-\varkappa}\right|=0, \quad\left|\mathrm{e}^{\frac{\beta_{k}}{\beta_{k}-\alpha_{k}}}-1\right| \leq 2
$$

and

$$
\left|z-z_{k}(0)\right| \leq \delta .
$$

Notice that if

$$
x_{0}(t)=\widetilde{x}+\int_{-1}^{t} \mathrm{~d}\left[a_{0}(t)\right] x_{0}(s) \quad \text { on } \quad[-1,1],
$$

then

$$
\Delta^{-} x_{0}(0)=\left(\frac{1}{1-\Delta^{-} a_{0}(0)}-1\right) x_{0}(0-)=\frac{\Delta^{-} a_{0}(0)}{1-\Delta^{-} a_{0}(0)} x_{0}(0-) .
$$

The convergence described in Example 2.7 is closely related to the notion of the emphatic convergence introduced by J. Kurzweil (cf. [5]).
2.8. Definition. A sequence $\left\{A_{k}\right\}_{k=1}^{\infty} \subset \mathbf{B V}^{n \times n}$ converges emphatically to $A_{0} \in$ $\mathrm{BV}^{n \times n}$ on $[0,1]$ if
(i) there exist nondecreasing functions $h_{k}:[0,1] \rightarrow \mathbf{R}, k \in \mathbf{N} \cup\{0\}$, which are left-continuous on $(0,1]$ and such that

$$
\left|A_{k}\left(t_{2}\right)-A_{k}\left(t_{1}\right)\right| \leq\left|h_{k}\left(t_{2}\right)-h_{k}\left(t_{1}\right)\right|
$$

for all $k \in \mathbf{N} \cup\{0\}$ and $t_{1}, t_{2} \in[0,1]$;
(ii) $\lim \sup _{k \rightarrow \infty}\left[h_{k}\left(t_{2}\right)-h_{k}\left(t_{1}\right)\right] \leq\left[h_{0}\left(t_{2}\right)-h_{0}\left(t_{1}\right)\right]$ whenever $0 \leq t_{1} \leq t_{2} \leq 1$ and $h_{0}$ is continuous at $t_{1}$ and $t_{2}$;
(iii) there is $\widetilde{A}_{0} \in \mathrm{BV}^{n \times n}$ such that $\lim _{\tilde{A}_{k \rightarrow \infty}} A_{k}(t)=A_{0}(t)+\widetilde{A}_{0}(t)$ whenever $h_{0}(t)=$ $h_{0}(t+)$ and $\left|\widetilde{A}_{0}\left(t_{2}\right)-\widetilde{A}_{0}\left(t_{1}\right)\right| \leq\left|\widetilde{h}_{0}\left(t_{2}\right)-\widetilde{h}_{0}\left(t_{1}\right)\right|$ for all $t_{1}, t_{2} \in[0,1]$, where $\widetilde{h}_{0}$ stands for the break part of $h_{0}$;
(iv) if $h_{0}\left(t_{0}+\right)>h_{0}\left(t_{0}\right)$, then for any $z \in \mathbf{R}^{n}$ and any $\varepsilon>0$ there exists $\delta>0$ such that for any $\delta^{\prime} \in(0, \delta)$ there is $k_{0} \in \mathbf{N}$ such that

$$
\left|y_{k}\left(t_{0}+\delta^{\prime}\right)-y_{k}\left(t_{0}-\delta^{\prime}\right)-\Delta^{+} A_{0}\left(t_{0}\right) z\right| \leq \varepsilon
$$

holds for any $k \geq k_{0}$, any $\widetilde{y}_{k} \in \mathbf{R}^{n}$ such that $\left|z-\widetilde{y}_{k}\right| \leq \delta$ and any solution $y_{k}$ of the equation

$$
y_{k}(t)=\widetilde{y}_{k}+\int_{t_{0}-\delta^{\prime}}^{t} \mathrm{~d}\left[A_{k}(s)\right] y_{k}(s) \quad \text { on } \quad\left[t_{0}-\delta^{\prime}, t_{0}+\delta^{\prime}\right] .
$$

The following assertion is a restriction of Theorem 4.1 from [5] to the linear case.
2.9. Theorem. Let $A_{k}$ converge emphatically on $[0,1]$ to $A_{0}$. Let the sequence $\left\{X_{k}\right\}_{k=1}^{\infty} \subset \mathbf{B V}^{n \times n}$ of the fundamental matrices corresponding respectively to $A_{k}$, $k \in \mathbf{N}$, be uniformly bounded on $[0,1]$ and such that

$$
\lim _{k \rightarrow \infty} X_{k}(t)=Z_{0}(t) \quad \text { on }[0,1] \quad \text { whenever } h_{0}(t+)=h_{0}(t) .
$$

Then $Z_{0} \in \mathrm{BV}^{n \times n}$ and the function $X_{0}$ defined by

$$
X_{0}(t)= \begin{cases}Z_{0}(t) & \text { if } h_{0}(t+)=h_{0}(t) \\ Z_{0}(t-) & \text { otherwise }\end{cases}
$$

is the fundamental matrix corresponding to $A_{0}$.
2.10. Remark. Let us notice that necessary and sufficient conditions assuring the uniform convergence of fundamental matrices $X_{k}$ corresponding to $A_{k}, k \in \mathbf{N}$, to the fundamental matrix $X_{0}$ corresponding to $A_{0}$ may be found in the paper [2] by M. Ashordia.

Results related to Theorem 2.9 obtained by the method of "prolongation" of functions of bounded variation to continuous functions along monotone functions and using the concept of convergence under substitution instead of the emphatic convergence were obtained by D. Fraňková in [3] (cf. also [4]), as well.

## 3. Linear GDE's - new results

3.1. Notation. For a given function $F \in \mathbf{B V}^{n \times n}$, the symbol $\mathbf{S}(F)$ stands for the set of the points of discontinuity of $F$ in $[0,1]$, while

$$
\mathbf{S}^{+}(F)=\left\{t \in[0,1) ; \Delta^{+} F(t) \neq 0\right\} \text { and } \mathbf{S}^{-}(F)=\left\{t \in[0,1) ; \Delta^{-} F(t) \neq 0\right\}
$$

If $F$ is such that $\mathbf{S}(F)$ possesses at most a finite number of points, then for an arbitrary compact set $M$ such that

$$
M=\bigcup_{j=1}^{m}\left[\alpha_{j}, \beta_{j}\right] \subset[0,1] \backslash \mathbf{S}(F)
$$

with $\left[\alpha_{j}, \beta_{j}\right] \cap\left[\alpha_{k}, \beta_{k}\right]=\emptyset$ for $j \neq k$, we define

$$
F^{M}(t)=F(t)-F\left(\alpha_{j}\right) \quad \text { if } t \in\left[\alpha_{j}, \beta_{j}\right] .
$$

Provided the set $\mathbf{S}\left(A_{0}\right)$ contains at most a finite number of elements, we can extend Theorem 2.9 to the case that the functions $A_{k}, k \in \mathbf{N} \cup\{0\}$, need not be left-continuous on $(0,1]$ in the following way.
3.2. Theorem. Let $A_{0} \in \mathbf{B V}^{n \times n}, \mathbf{S}\left(A_{0}\right)=\left\{\tau_{j}\right\}_{j=1}^{m}$,

$$
\operatorname{det}\left[\mathrm{I}-\Delta^{-} A_{0}(t)\right] \neq 0 \quad \text { on } \quad[0,1]
$$

and let $X_{0}$ be the fundamental matrix solution corresponding to $A_{0}$. Let the sequence $\left\{A_{k}\right\}_{k=1}^{\infty} \subset \mathbf{B V}^{n \times n}$ be such that
(i) $\sup _{k} \operatorname{var}_{0}^{1} A_{k}<\infty$ and $\operatorname{det}\left[\mathrm{I}-\Delta^{-} A_{k}(t)\right] \neq 0$ on $(0,1]$ for all $k \in \mathbf{N}$;
(ii) $\lim _{k \rightarrow \infty} A_{k}^{M}(s)=A_{0}^{M}(s)$ uniformly on $M$ for any $M \subset[0,1] \backslash \mathbf{S}\left(A_{0}\right)$ such that $M=\bigcup_{j=1}^{m}\left[\alpha_{j}, \beta_{j}\right]$, where $\left[\alpha_{j}, \beta_{j}\right] \cap\left[\alpha_{k}, \beta_{k}\right]=\emptyset$ for $j \neq k ;$
(iii) if $\tau \in \mathbf{S}\left(A_{0}\right)$ then for any $z \in \mathbf{R}^{n}$ and any $\varepsilon>0$ there exists $\delta>0$ such that for any $\delta^{\prime} \in(0, \delta)$ there is $k_{0} \in \mathbf{N}$ such that the relations

$$
\left|y_{k}(\tau)-y_{k}\left(\tau-\delta^{\prime}\right)-\Delta^{-} A_{0}(\tau)\left[\mathrm{I}-\Delta^{-} A_{0}(\tau)\right]^{-1} z\right| \leq \varepsilon
$$

and

$$
\left|z_{k}\left(\tau+\delta^{\prime}\right)-z_{k}(\tau)-\Delta^{+} A_{0}(\tau) z\right| \leq \varepsilon
$$

are satisfied for any $k \geq k_{0}$ and $y_{k}$ and $z_{k}$ such that

$$
\begin{array}{lll}
y_{k}(t)=y_{k}\left(\tau-\delta^{\prime}\right) & +\int_{\tau-\delta^{\prime}}^{t} \mathrm{~d}\left[A_{k}(s)\right] y_{k}(s) & \text { on }\left[\tau-\delta^{\prime}, \tau\right] \\
z_{k}(t)=z_{k}(\tau) & +\int_{\tau}^{t} \mathrm{~d}\left[A_{k}(s)\right] z_{k}(s) & \text { on }\left[\tau, \tau+\delta^{\prime}\right]
\end{array}
$$

and

$$
\left|z-y_{k}\left(\tau-\delta^{\prime}\right)\right| \leq \delta \quad \text { and } \quad\left|z-z_{k}(\tau)\right| \leq \delta
$$

Then for any $k \in \mathbf{N}$ sufficiently large the fundamental matrix $X_{k}$ corresponding to $A_{k}$ is defined on $[0,1]$ and

$$
\lim _{k \rightarrow \infty} X_{k}(t)=X_{0}(t) \quad \text { on } \quad[0,1] .
$$

Proof. Let us restrict ourselves to the case that $m=1$, i.e. let $\mathbf{S}\left(A_{0}\right)=\{\tau\}$, where $\tau \in(0,1)$.

Let an arbitrary $\widetilde{x} \in \mathbf{R}^{n}$ be given and let $x_{k}$ for any $k \in \mathbf{N} \cup\{0\}$ denote the solution to the equation

$$
x_{k}(t)=\widetilde{x}+\int_{0}^{t} \mathrm{~d}\left[A_{k}(s)\right] x_{k}(s) \quad \text { on }[0,1] .
$$

Our assumptions (i) and (ii) by Theorem 2.5 imply that for any $\alpha \in(0, \tau)$ we have

$$
\begin{equation*}
\lim _{k \rightarrow \infty} x_{k}(t)=x_{0}(t) \quad \text { uniformly on }[0, \alpha] . \tag{3.1}
\end{equation*}
$$

Consequently,

$$
\begin{equation*}
\lim _{k \rightarrow \infty} x_{k}(t)=x_{0}(t) \quad \text { for all } t \in[0, \tau) \tag{3.2}
\end{equation*}
$$

Furthermore, for any $\delta^{\prime} \in(0, \tau)$ and $k \in \mathbf{N}$ we have

$$
\begin{align*}
& \left|x_{0}(\tau)-x_{k}(\tau)\right|  \tag{3.3}\\
& \leq\left|x_{0}(\tau)-x_{0}\left(\tau-\delta^{\prime}\right)-\Delta^{-} A_{0}(\tau)\left[\mathrm{I}-\Delta^{-} A_{0}(\tau)\right]^{-1} x_{0}(\tau-)\right| \\
& \quad+\left|\Delta^{-} A_{0}(\tau)\left[\mathrm{I}-\Delta^{-} A_{0}(\tau)\right]^{-1} x_{0}(\tau-)-\left(x_{k}(\tau)-x_{k}\left(\tau-\delta^{\prime}\right)\right)\right| \\
& \quad+\left|x_{0}\left(\tau-\delta^{\prime}\right)-x_{k}\left(\tau-\delta^{\prime}\right)\right| .
\end{align*}
$$

Let an arbitrary $\varepsilon>0$ be given. By the assumption (iii) there exists $\delta \in(0, \varepsilon)$ such that for all $\delta^{\prime} \in(0, \delta)$ there exists $k_{1}=k_{1}\left(\delta^{\prime}\right) \in \mathbf{N}$ such that for any $k \geq k_{1}$ and for any solution $y_{k}$ of the equation

$$
y_{k}(t)=y_{k}\left(\tau-\delta^{\prime}\right)+\int_{\tau-\delta^{\prime}}^{t} \mathrm{~d}\left[A_{k}(s)\right] y_{k}(s) \quad \text { on } \quad\left[\tau-\delta^{\prime}, \tau\right]
$$

such that $\left|y_{k}\left(\tau-\delta^{\prime}\right)-x_{0}(\tau-)\right|<\delta$ we have

$$
\begin{equation*}
\left|y_{k}(\tau)-y_{k}\left(\tau-\delta^{\prime}\right)-\Delta^{-} A_{0}(\tau)\left[\mathrm{I}-\Delta^{-} A_{0}(\tau)\right]^{-1} x_{0}(\tau-)\right|<\varepsilon . \tag{3.4}
\end{equation*}
$$

Let us choose $\delta^{\prime} \in(0, \delta)$ in such a way that

$$
\begin{equation*}
\left|x_{0}(\tau-)-x\left(\tau-\delta^{\prime}\right)\right|<\frac{\delta}{2} \tag{3.5}
\end{equation*}
$$

is true. Furthermore, according to (3.2) there is $k_{0} \in \mathbf{N}$ such that $k_{0} \geq k_{1}$ and

$$
\begin{equation*}
\left|x_{0}\left(\tau-\delta^{\prime}\right)-x_{k}\left(\tau-\delta^{\prime}\right)\right|<\frac{\delta}{2} \quad \text { for all } k \geq k_{0} \tag{3.6}
\end{equation*}
$$

In particular, for $k \geq k_{0}$ we have

$$
\begin{equation*}
\left|x_{0}(\tau-)-x_{k}\left(\tau-\delta^{\prime}\right)\right|<\delta . \tag{3.7}
\end{equation*}
$$

Thus, if we put $y_{k}(t)=x_{k}(t)$ on [ $\left.\tau-\delta^{\prime}, \tau\right]$, then the relation (3.4) will be satisfied for any $k \geq k_{0}$, i.e. we have

$$
\begin{equation*}
\left|x_{k}(\tau)-x_{k}\left(\tau-\delta^{\prime}\right)-\Delta^{-} A_{0}(\tau)\left[\mathrm{I}-\Delta^{-} A_{0}(\tau)\right]^{-1} x_{0}(\tau-)\right|<\varepsilon \tag{3.8}
\end{equation*}
$$

for all $k \geq k_{0}$. Now, inserting (3.6)-(3.8) into (3.3), we obtain that

$$
\left|x_{k}(\tau)-x_{0}(\tau)\right|<\frac{\delta}{2}+\frac{\delta}{2}+\varepsilon<2 \varepsilon
$$

is satisfied for any $k \geq k_{0}$, i.e.

$$
\begin{equation*}
\lim _{k \rightarrow \infty} x_{k}(\tau)=x_{0}(\tau) \tag{3.9}
\end{equation*}
$$

Further, we will prove that there is $\eta>0$ such that

$$
\lim _{k \rightarrow \infty} x_{k}(t)=x_{0}(t)
$$

is true on $(\tau, \tau+\eta)$ as well. To this aim, let $\varepsilon>0$ be given and let $\eta_{0} \in(0, \varepsilon)$ be such that

$$
\begin{equation*}
\left|x_{0}(s)-x_{0}(\tau+)\right|<\varepsilon \quad \text { for all } s \in\left(\tau, \tau+\eta_{0}\right) . \tag{3.10}
\end{equation*}
$$

By the assumption (iii) there exists $\eta \in\left(0, \eta_{0}\right)$ such that for any $\eta^{\prime} \in(0, \eta)$ there is $\ell_{1}=\ell_{1}\left(\eta^{\prime}\right) \in \mathbf{N}$ such that for any $k \geq \ell_{1}$ and for any solution $z_{k}$ of the equation

$$
z_{k}(t)=z_{k}(\tau)+\int_{\tau}^{t} \mathrm{~d}\left[A_{k}(s)\right] z_{k}(s) \text { on }\left[\tau, \tau+\eta^{\prime}\right]
$$

such that $\left|z_{k}(\tau)-x_{0}(\tau)\right|<\eta$ we have

$$
\begin{equation*}
\left|z_{k}\left(\tau+\eta^{\prime}\right)-z_{k}(\tau)-\Delta^{+} A_{0}(\tau) x_{0}(\tau)\right|<\varepsilon \tag{3.11}
\end{equation*}
$$

Let us choose $\eta^{\prime} \in(0, \eta)$ arbitrarily. By (3.10), we have

$$
\begin{equation*}
\left|x_{0}\left(\tau-\eta^{\prime}\right)-x_{0}(\tau+)\right|<\varepsilon . \tag{3.12}
\end{equation*}
$$

Furthermore, by (3.9) there is $\ell_{0} \in \mathbf{N}$ such that $\ell_{0} \geq \ell_{1}$ and

$$
\begin{equation*}
\left|x_{k}(\tau)-x_{0}(\tau)\right|<\eta \quad \text { for all } k \geq \ell_{0} \tag{3.13}
\end{equation*}
$$

Thus, by (3.11), for any $k \geq \ell_{0}$ we have

$$
\begin{equation*}
\left|x_{k}\left(\tau+\eta^{\prime}\right)-x_{k}(\tau)-\Delta^{+} A_{0}(\tau) x_{0}(\tau)\right|<\varepsilon \tag{3.14}
\end{equation*}
$$

Making use of (3.12)-(3.14) we finally get for any $k \geq k_{0}$

$$
\begin{aligned}
& \left|x_{k}\left(\tau+\eta^{\prime}\right)-x_{0}\left(\tau+\eta^{\prime}\right)\right| \\
& \leq \leq\left|x_{k}\left(\tau+\eta^{\prime}\right)-x_{k}(\tau)-x_{0}(\tau+)+x_{0}(\tau)\right| \\
& \quad+\left|x_{0}\left(\tau+\eta^{\prime}\right)-x_{0}(\tau+)\right|+\left|x_{k}(\tau)-x_{0}(\tau)\right| \\
& =\left|x_{k}\left(\tau+\eta^{\prime}\right)-x_{k}(\tau)-\Delta^{+} A_{0}(\tau) x_{0}(\tau)\right| \\
& \quad+\left|x_{0}(\tau+)-x_{0}\left(\tau+\eta^{\prime}\right)\right|+\left|x_{k}(\tau)-x_{0}(\tau)\right|<3 \varepsilon
\end{aligned}
$$

i.e.

$$
\lim _{k \rightarrow \infty} x_{k}(t)=x_{0}(t) \quad \text { for all } t \in(\tau, \tau+\eta)
$$

The proof of the theorem can be completed by making use of Theorem 2.5 and taking into account that $\widetilde{x} \in \mathbf{R}^{n}$ was chosen arbitrarily. The extension to a general case $m \in \mathbf{N}$ is obvious.
3.3. Remark. Obviously, if we did not restrict ourselves to the case of only a finite number of discontinuities of $A_{0}$, we should replace the assumptions (i)-(ii) in Theorem 3.2 by assumptions of the form (i)-(ii) from Definition 2.8.
3.4. Remark. The following concept due to M. Pelant (cf. [7]) leads to another interesting convergence effect which most probably cannot be explained by Theorem 3.2.

Let $A \in \mathbf{B V}^{n \times n}$ and let the divisions $\mathcal{P}_{k}=\left\{0=t_{0}^{k}<\cdots<t_{p_{k}}^{k}=1\right\}, k \in \mathbf{N}$, of $[0,1]$ be such that

$$
\begin{array}{r}
\mathcal{P}_{k} \supset \mathcal{D}_{k}=\left\{t \in[0,1] ; t=\frac{i}{2^{k}}, i=0,1, \ldots 2^{k}\right\} \\
\cup\left\{t \in(0,1] ;\left|\Delta^{-} A(t)\right| \geq \frac{1}{k}\right\} \\
\cup\left\{t \in[0.1) ;\left|\Delta^{+} A(t)\right| \geq \frac{1}{k}\right\}
\end{array}
$$

For a given $k \in \mathbf{N}$, let us put

$$
A_{k}(t)= \begin{cases}A(t) & \text { if } t \in \mathcal{P}_{k} \\ A\left(t_{i-1}^{k}\right)+\frac{A\left(t_{i}^{k}\right)-A\left(t_{i-1}^{k}\right)}{t_{i}^{k}-t_{i-1}^{k}}\left(t-t_{i-1}^{k}\right) & \text { if } t \in\left(t_{i-1}^{k}, t_{i}^{k}\right)\end{cases}
$$

Then we say that the sequence $\left\{A_{k}, \mathcal{P}_{k}\right\}_{k=1}^{\infty}$ piecewise linearly approximates $A$.
Furthermore, for a given $A \in \mathbf{B V}^{n \times n}$, let us define $A_{0}$ on $[0,1]$ by

$$
\begin{align*}
A_{0}(t)= & A(t)-\sum_{s \in \mathbf{S}^{-}(A)} \Delta^{-} A(s) \chi_{[s, 1]}(t)  \tag{3.15}\\
& -\sum_{s \in \mathbf{S}^{+}{ }_{(A)}} \Delta^{+} A(s) \chi_{(s, 1]}(t) \\
& +\sum_{s \in \mathbf{S}^{-}{ }_{(A)}}\left(\mathrm{I}-\left[\exp \left(\Delta^{-} A(s)\right)\right]^{-1}\right) \chi_{[s, 1]}(t) \\
& +\sum_{s \in \mathbf{S}^{+}{ }_{(A)}}\left(\exp \left(\Delta^{+} A(s)\right)-\mathrm{I}\right) \chi_{(s, 1]}(t) .
\end{align*}
$$

Then, obviously

$$
\operatorname{det}\left[\mathrm{I}-\Delta^{-} A_{0}(t)\right] \neq 0 \quad \text { on }[0,1]
$$

holds and the following assertion may be proved (cf. [7]).

Let $A \in \mathbf{B V}^{n \times n}$, let $A_{0}$ be given by (3.15), let $\left\{A_{k}, \mathcal{P}_{k}\right\}_{k=1}^{\infty}$ piecewise linearly approximate $A$ and let for a given $k \in \mathbf{N}, X_{k}$ denote the fundamental matrix corresponding to $A_{k}$. Then

$$
\lim _{k \rightarrow \infty} X_{k}(t)=X_{0}(t) \quad \text { for all } t \in[0,1] .
$$

Furthermore, if $A \in \mathbf{B V}^{n \times n}$ is such that the relations

$$
\begin{equation*}
\operatorname{det}\left[\mathrm{I}-\Delta^{-} A(t)\right] \neq 0 \quad \text { and } \quad \operatorname{det}\left[\mathrm{I}+\Delta^{+} A(t)\right] \neq 0 \quad \text { on }[0,1] \tag{3.16}
\end{equation*}
$$

are true, then for $t \in[0,1]$ we can define

$$
\begin{align*}
A_{0}^{*}(t)= & A(t)-\sum_{s \in \mathbf{S}^{-}(A)} \Delta^{-} A(s) \chi_{[s, 1]}(t)  \tag{3.17}\\
& -\sum_{s \in \mathbf{S}^{+}(A)} \Delta^{+} A(s) \chi_{(s, 1]}(t) \\
& +\sum_{s \in \mathbf{S}^{-}{ }_{(A)}} \ln \left[\mathrm{I}-\Delta^{-} A(s)\right]^{-1} \chi_{[s, 1]}(t) \\
& +\sum_{s \in \mathbf{S}^{+}(A)} \ln \left[\mathrm{I}+\Delta^{+} A(s)\right] \chi_{(s, 1]}(t)
\end{align*}
$$

and the following assertion is an immediate corollary of the above mentioned result of M. Pelant.
3.5. Theorem. Let $A \in \mathbf{B V}^{n \times n}$ be such that (3.16) holds and let $X$ be the fundamental matrix corresponding to $A$. Let $A_{0}^{*}$ be given by (3.17), let $\left\{A_{k}, \mathcal{P}_{k}\right\}_{k=1}^{\infty}$ piecewise linearly approximate $A_{0}^{*}$ and let for a given $k \in \mathbf{N}, X_{k}$ denote the fundamental matrix corresponding to $A_{k}$. Then

$$
\lim _{k \rightarrow \infty} X_{k}(t)=X(t) \quad \text { for all } t \in[0,1] .
$$
