The background

Belief is a propositional attitude

Timothy Childers and Ondrej Majer (ASCR)

The background

- Belief is a propositional attitude
- Partial belief is a species of belief, and so also a propositional attitude

The background

- Belief is a propositional attitude
- Partial belief is a species of belief, and so also a propositional attitude
- Differing theories of propositional attitudes = different foundations of subjective probability

• Propositional attitudes are, being attitudes, mental

- Propositional attitudes are, being attitudes, mental
- Some would prefer no to have to deal with mental entities

< 17 ▶

- Propositional attitudes are, being attitudes, mental
- Some would prefer no to have to deal with mental entities
- Quine proposed taking propositional attitudes as dispositions to behaviour

▲ 同 ▶ | ▲ 三 ▶

- Propositional attitudes are, being attitudes, mental
- Some would prefer no to have to deal with mental entities
- Quine proposed taking propositional attitudes as dispositions to behaviour
- If someone believes *p*, then they are disposed to assent to *p*

- Propositional attitudes are, being attitudes, mental
- Some would prefer no to have to deal with mental entities
- Quine proposed taking propositional attitudes as dispositions to behaviour
- If someone believes *p*, then they are disposed to assent to *p*
 - Upon hearing p uttered in appropriate circumstances they will utter yes

- Propositional attitudes are, being attitudes, mental
- Some would prefer no to have to deal with mental entities
- Quine proposed taking propositional attitudes as dispositions to behaviour
- If someone believes *p*, then they are disposed to assent to *p*
 - Upon hearing p uttered in appropriate circumstances they will utter yes
- This is also an *eliminativist* account

Timothy Childers and Ondrej Majer (ASCR)

FUPIR 2009 4 / 21

э

• If someone partially believes that *p*, then they will be inclined to partially assent to *p*

- If someone partially believes that *p*, then they will be inclined to partially assent to *p*
 - They will under appropriate circumstances enter into a wager on p

- If someone partially believes that *p*, then they will be inclined to partially assent to *p*
 - They will under appropriate circumstances enter into a wager on p

One way of testing belief, powerful where applicable, is by calling upon the professed believer to put his money where his mouth is. Acceptance of a wager evinces sincerity, and the odds accepted conveniently measure the strength of the belief. Quine 1987 18-19

- If someone partially believes that *p*, then they will be inclined to partially assent to *p*
 - They will under appropriate circumstances enter into a wager on p

One way of testing belief, powerful where applicable, is by calling upon the professed believer to put his money where his mouth is. Acceptance of a wager evinces sincerity, and the odds accepted conveniently measure the strength of the belief. Quine 1987 18-19

• Caveat: "But this method is applicable only in cases where the believed proposition is one that can eventually be decided to the satisfaction of both parties, that that the bet can be settled." Quine 1987 18-19, although this applies to all sentences, including tautologies, for Quine.

- We need to get the internal representations out
- For probabilities we need an external representation we shall call it reference experiment - an idealized random device, such that subject understands its functioning.

FUPIR 2009

- We need to get the internal representations out
- For probabilities we need an external representation we shall call it reference experiment - an idealized random device, such that subject understands its functioning.
- Subject is able to compare subjective events to the 'reference' events which provide a reference measure for the subjective events.

- We need to get the internal representations out
- For probabilities we need an external representation we shall call it reference experiment - an idealized random device, such that subject understands its functioning.
- Subject is able to compare subjective events to the 'reference' events which provide a reference measure for the subjective events.
- They allow us to substitute familiar quantities like length, volume, area, for the decidedly less familiar quantity of degree of belief.

(i) There is a partial probability function p on ${\cal F}$ that respects the ordering \precsim

FUPIR 2009

Let \mathcal{F}, \preceq be a partial probability structure corresponding to a reference experiment $\mathcal{G}, I, \preceq_{ref}$ Then:

- (i) There is a partial probability function p on $\mathcal F$ that respects the ordering \precsim
- (ii) G is a completion of the partial structure F and there is a probability function p' on G such that p' restricted to F is p.

• It may seem we've pulled a rabbit, or a probability, out of a hat

- It may seem we've pulled a rabbit, or a probability, out of a hat
- Is our representation theorem weaker?
- No qualitative probabilities aren't enough, so something else is doing the work

- It may seem we've pulled a rabbit, or a probability, out of a hat
- Is our representation theorem weaker?
- No qualitative probabilities aren't enough, so something else is doing the work
- It's Correspondence

- It may seem we've pulled a rabbit, or a probability, out of a hat
- Is our representation theorem weaker?
- No qualitative probabilities aren't enough, so something else is doing the work
- It's Correspondence
- Any homomorphism has to be measure preserving, which is as strong as the assumption of a uniform distribution

 What about rationality? Our approach fairs better than dispositionalism because we seek to explain, not to justify

- It may seem we've pulled a rabbit, or a probability, out of a hat
- Is our representation theorem weaker?
- No qualitative probabilities aren't enough, so something else is doing the work
- It's Correspondence
- Any homomorphism has to be measure preserving, which is as strong as the assumption of a uniform distribution
- What does this say about representationalism?
- Only get out what you put in so the choice of the constraints on the reference experiment are crucial to the strength of the uncertainty ordering
- What about rationality? Our approach fairs better than dispositionalism because we seek to explain, not to justify
- And it's more fundamental, since we can add in sanctions on top of the reference experiment
