The company has developed an innovative technology for water treatment. The process of suitable preparation is utilised on water areas (ponds, lakes, reservoirs). It is especially suitable for prophylaxis on water areas, during water crash (chemical waste, biological waste, cyanophytes) and also as preventive measures.

The basic principle of this technology of creating ion net is utilisation of electro-physical and electrochemical activity on the environment treated (such as the water in water basin). The activity in electrochemical source creates ions and thus causes controlled mutation of physio-chemical character of water and can also affect its structural and energetic character.
