

Computer Simulations of Chemical Reactions in Solution and Biomolecules

MSc. and Ph.D. Course

Lubomír Rulíšek and Martin Srnec

September 16, 2015

TABLE OF CONTENTS (SYLLABUS)

1. **Introduction to Molecular Modeling:** *Historical Developments, Literature*
2. **Quantum Mechanics:** *Key Concepts, Methods, and Machinery*
3. **Molecular Mechanics:** *Key Concepts, Methods, and Machinery*
4. **Statistical Thermodynamics:** *Essential Concepts (Partition Functions, Boltzmann Population, Entropy, Enthalpy, Free Energy)*
5. **Solvation Methods:** *Polarized Continuum Methods (PCM), Conductor-Like Screening Model (COSMO, COSMO-RS), Explicit Solvation, PBSA/GBSA Methods*
6. **QM/MM Methods:** *Background, Theory, Applications, and Case Studies (Reaction Mechanisms of Enzymes)*
7. **Thermodynamic Cycles for Computation of a Free–Energy Change in Condensed Phase:** *Concepts, Applications (Reduction Potentials and Acidity Constants)*
8. **Free Energy Perturbation (Thermodynamic Integration) and PMF Methods:** *Concept, Theory, Applications*
9. **Transition State Theory:** *Eyring Equation (Theory, Applicability and Limitations, Kinetic Isotope Effects, Tunneling Correction), More Advanced Theories (Variational Transition State Theory)*
10. **Modelling Chemical Reactions in Solution:** *Theory and Applications*
11. **Physical Chemistry of Enzyme Catalysis I:** *Reaction Rate and Order, Michaelis-Menten Equation, Metals in Enzymology (Stability Constants, Selectivity, Magnetism, Spectroscopy, Redox and Spin-State Activity)*
12. **Physical Chemistry of Enzyme Catalysis II:** *Theoretical Calculations of Reaction Profiles, Electron Transfer Kinetics and Redox Reactions, Marcus Theory, Adiabatic versus Non-adiabatic reaction dynamics (Landau-Zener model and beyond)*
13. **Physical Chemistry of Enzyme Catalysis III - Metaloenzymes:** *Crystal/Ligand Field Theory, DFT vs. WFT theories (Advantages and Pitfalls), Relativistic Effects (on Reactivity).*
14. **Recent Advances in Molecular Modeling.** *Outlook and Summary.*
