# **Dielectric in Static Electric and Magnetic Fields**

Applied external electric field  $E_0$ (homogeneous, constant) Infinite dielectric (ignore boundary effects)

Charges move in response to  $E_0$ Average charge density still zero Induced (depolarizing) electric field  $E_1$ weakens applied field  $\mathbf{E}_{0}$ .

#### Local electric field

 $E=E_{local}=E_0+E_1$ Metal:  $E_{local}=0$  (for  $\omega=0$ )  $E_{local} < E_0$  (screening) E<sub>local</sub> depends on crystal shape (boundary conditions), see Nye.

Nye, Physical Properties of Crystals Stefan Zollner, February 2019, Optical Properties of Solids Lecture 4

# Dielectric Polarization, Dielectric Displacment

Applied external electric field **E**<sub>0</sub> (homogeneous, constant) Infinite dielectric (ignore boundary effects)

Total electric field E

Charges move: Dipole moment p=qd (d from -q to +q)

#### **Dielectric polarization P**

Dipole moment per unit volume Dielectric Displacement: D=ε<sub>0</sub>E+P Linear dielectric susceptibility

**Dielectric constant:**  $\epsilon$ =1+ $\chi_e$ , **D**= $\epsilon_0\epsilon$ **E** 

Nye, Physical Properties of Crystals

## Magnetostatics and Magnetization

Electric field strength **E** Dielectric polarization **P**: electric dipole moment per unit volume Dielectric displacement  $D = \varepsilon_0 E + P = P_r + \varepsilon_0 E + \varepsilon_0 \chi_e E + \varepsilon_0 \delta H$ Magnetic field strength **H** Magnetization **M**: magnetic dipole moment per unit volume  $M = M_r + \mu_0 \chi_m H + \mu_0 \gamma E$  ( $M_r$  remanence,  $\partial M_r / \partial t = 0$ ) Magnetic susceptibility  $\chi_m$ 

#### Magnetic flux density **B** $B=\mu_0H+M=M_r+\mu_0\mu H+\mu_0\gamma E$ $\mu=1+\chi_m$ magnetic permeability ( $\mu=1$ unless $\omega=0$ )

# AC Response Function: Dispersion, Nonlocality

How does a dielectric respond to an electromagnetic wave?

$$\vec{E}(\vec{r},t) = \vec{E}_{0} \exp\left[i\left(\vec{k}\cdot\vec{r}-\omega t\right)\right]$$
Polarization may be delayed.  
Polarization may be non-local.  

$$\vec{P}(\vec{r},t) = \varepsilon_{0} \int_{-\infty}^{t} \chi_{e}(\vec{r}',\vec{r},t',t)\vec{E}(\vec{r}',t')dt'd^{3}\vec{r}'$$
Time invariance  
Infinite homogeneous crystal  

$$\vec{P}(\vec{r},t) = \varepsilon_{0} \int_{-\infty}^{t} \chi_{e}(\vec{r}'-\vec{r},t'-t)\vec{E}(\vec{r}',t')dt'd^{3}\vec{r}'$$
Use convolution theorem for Fourier transforms  

$$\vec{P}(\vec{k},\omega) = \varepsilon_{0}\chi_{e}(\vec{k},\omega)\vec{E}(\vec{k},\omega)$$
Nonlocal effects scale like  $2\pi a/\lambda$   
Dielectric function  $\varepsilon$  depends on frequency  $\omega$  (dispersion).

Stefan Zollner, February 2019, Optical Properties of Solids Lecture 4

**New Mexico State University** 

#### Causality: Charge Movement Follows the Field

$$\vec{P}(\vec{r},t) = \varepsilon_0 \int \chi_e(\vec{r}' - \vec{r},t' - t)\vec{E}(\vec{r}',t')dt'd^3\vec{r}'$$

Response function  $\chi_e(\vec{r}' - \vec{r}, t' - t) = 0$  for t' > tThe charges cannot move before the field has been applied. <u>Kramers-Kronig relations</u> follow:  $\chi(\omega)$ 

$$\vec{D}(\vec{k},\omega) = \varepsilon_0 \varepsilon(\vec{k},\omega) \vec{E}(\vec{k},\omega)$$

$$\varepsilon_{1}(\omega) - 1 = \frac{2}{\pi} \wp \int_{0}^{\infty} \frac{\omega' \varepsilon_{2}(\omega') d\omega'}{\omega'^{2} - \omega^{2}}$$
$$\varepsilon_{2}(\omega) = -\frac{2\omega}{\pi} \wp \int_{0}^{\infty} \frac{\varepsilon_{1}(\omega') d\omega'}{\omega'^{2} - \omega^{2}}$$

Contour integrals in complex plane: The real part of  $\varepsilon$  can be calculated if the imaginary part is known (and vice versa).

Similar Kramers-Kronig relations for other optical constants

New Mexico State University

# **Maxwell's Equations for Continuous Media**

 $\vec{\nabla} \cdot \vec{D} = \rho = \mathbf{0}$  $\vec{\nabla} \cdot \vec{B} = \mathbf{0}$  $\vec{\nabla} \times \vec{E} = -\frac{\partial \vec{B}}{\partial t}$  $\vec{\nabla} \times \vec{H} = \vec{J} + \frac{\partial \vec{D}}{\partial t} = \frac{\partial \vec{D}}{\partial t}$ 

Gauss' Law (Coulomb) Gauss' Law (magnetic field)

Faraday's Law

Ampere's Law

# Anisotropic wave equation:

Take curl on both sides in Ampere's Law and Faraday's Law

$$\Delta \vec{E} - \vec{\nabla} (\vec{\nabla} \cdot \vec{E}) = \mu_0 \frac{\partial}{\partial t} \vec{\nabla} \times \mu \vec{H}$$
$$\Delta \vec{H} - \vec{\nabla} (\vec{\nabla} \cdot \vec{H}) = -\varepsilon_0 \frac{\partial}{\partial t} \vec{\nabla} \times \varepsilon \vec{E}$$

The terms in red do not vanish (cannot be simplified) in anisotropic media.

#### **Isotropic wave equation:**

$$\Delta \vec{E} = \frac{\epsilon \mu}{c^2} \frac{\partial^2}{\partial t^2} \vec{D} = \frac{v_{\text{phase}}}{v_{\text{phase}}} = \frac{c}{\sqrt{\epsilon \mu}} = \frac{c}{n} = \frac{c}{Refractive index n} = \sqrt{\epsilon}$$

# **Assume** µ=1: **Crystal Optics**

 $\vec{\nabla} \cdot \vec{D} = \rho = \mathbf{0}$  $\vec{\nabla} \cdot \vec{B} = \mathbf{0}$  $\vec{\nabla} \times \vec{E} = -\frac{\partial \vec{B}}{\partial t}$  $\vec{\nabla} \times \vec{H} = \vec{J} + \frac{\partial \vec{D}}{\partial t} = \frac{\partial \vec{D}}{\partial t}$ 

Gauss' Law (Coulomb) Gauss' Law (magnetic field) Faraday's Law

Ampere's Law

## Anisotropic wave equation:

Take curl on both sides in Ampere's Law and Faraday's Law

$$\Delta \vec{E} - \vec{\nabla} \left( \vec{\nabla} \cdot \vec{E} \right) = \frac{1}{c^2} \frac{\partial^2}{\partial t^2} \epsilon \vec{E}$$
$$\Delta \vec{H} = -\varepsilon_0 \frac{\partial}{\partial t} \vec{\nabla} \times \varepsilon \vec{E}$$

For  $\mu$ =1 we get a single wave equation for **E**, from which **H** can be calculated as well.

Use Berreman / Yeh 4x4 matrix formalism for (**E**,**H**).

Stefan Zollner, February 2019, Optical Properties of Solids Lecture 4

Agranovitch & Ginzburg, Crystal Optics

# **Generalized Plane Waves**

#### Plane waves do not solve Maxwell's equations, if $Im(\varepsilon) \neq 0$ .

The amplitude of the plane wave decays in the medium due to absorption. Snell:  $\frac{\sin \theta_1}{\sin \theta_2} = \frac{n_1}{n_2}$ 

# Generalized plane wave: $\vec{E}(\vec{r},t) = \vec{E}_0 \exp[i(\vec{k}\cdot\vec{r}-\omega t)]$ Allow complex wave vector: $\vec{k} = \vec{k}_1 + i\vec{k}_2 = k_1\vec{u} + ik_2\vec{v}$ $\vec{E}(\vec{r},t) = \vec{E}_0 \exp[-\vec{k}_2\cdot\vec{r}] \exp[i(\vec{k}_1\cdot\vec{r}-\omega t)]$ Attenuation Propagation Mansuripur, Magneto-Optical Recording, 1995

 $\vec{D}_0(\vec{k},\omega) = \varepsilon_0 \varepsilon(\vec{k},\omega) \vec{E}_0(\vec{k},\omega)$  $\vec{B}_0(\vec{k},\omega) = \mu_0 \mu(\vec{k},\omega) \vec{H}_0(\vec{k},\omega)$ 

**Anisotropic wave equation:** 

$$\left|\vec{k}\right|^{2}\vec{E}_{0} - \left(\vec{k}\cdot\vec{E}_{0}\right)\vec{k} = \frac{\omega^{2}}{c^{2}}\varepsilon\vec{E}_{0}$$

 $\left|\vec{k}\right|^{2}\vec{H}_{0} = -\varepsilon_{0}\omega\vec{k}\times\varepsilon\vec{E}_{0}$ **Isotropic wave equation:**  **Constitutive Relations** 

Algebraic equation for **E**, from which H can be calculated.

# **Longitudinal Solutions to Maxwell's Equations**

 $\vec{k} \cdot \varepsilon \vec{E}_0 = 0$  $\vec{k} \cdot \vec{B}_0 = 0$  $\vec{k} \times \vec{E}_0 = \omega \vec{B}_0$  $\vec{k} \times \vec{H}_0 = -\omega \varepsilon \vec{E}_0$ 

Gauss' Law (Coulomb) Gauss' Law (magnetic field) Faraday's Law Ampere's Law

Transverse solution: D is transverse

$$\Box 0 \text{ and } \left|\vec{k}\right|^{2} \vec{E}_{0} - \left(\vec{k} \cdot \vec{E}_{0}\right) \vec{k} = \frac{\omega^{2}}{c^{2}} \varepsilon \vec{E}_{0} \text{ and } \left|\vec{k}\right|^{2} \vec{H}_{0} = -\varepsilon_{0} \omega \vec{k} \times \varepsilon \vec{E}_{0}$$

**Longitudinal solution:** 

$$\varepsilon = 0$$
 and  $\vec{E}_0 \parallel \vec{k}$  and  $\vec{H}_0 = 0$ 

Longitudinal solutions are also called plasmons.

Agranovitch & Ginzburg, Crystal Optics

## Berreman Modes: Insulator (LiF) on Metal (Ag)

Humlicek: The Berreman mode is an interference effect, which occurs when  $\epsilon_{film}$ =0. It is not a longitudinal mode.

D.W. Berreman, Phys. Rev. **130**, 2193 (1963) J. Humlicek, phys. stat. sol. (b) **215**, 155 (1999) New Mexico State Oniversity State Stefan Zollner, February 2019, Optical Properties of Solids Lecture 4

# **Energy density, Poynting Vector**

Energy density:

Energy  
density:  
$$\begin{aligned} u &= \frac{1}{2} \left( \vec{E} \cdot \vec{D} + \vec{H} \cdot \vec{B} \right) = \frac{1}{2} \left( \vec{E} \cdot \varepsilon_0 \epsilon \vec{E} + \vec{H} \cdot \mu_0 \mu \vec{H} \right) \\ \frac{\partial^2 u}{\partial E_i \partial E_j} &= \frac{\varepsilon_0}{2} \varepsilon_{ij} \quad \text{Implies } \varepsilon_{ij} \text{ symmetric tensor (B=0).} \\ \text{Onsager relation} \end{aligned}$$
in isotropic medium: 
$$u &= \frac{\epsilon \epsilon_0}{2} \left| \vec{E} \right|^2 \end{aligned}$$

#### **Poynting's theorem (energy flow):**

 $\frac{\partial u}{\partial t} = -\vec{\nabla} \cdot \vec{S} - \vec{J} \cdot \vec{E}$  EM wave has no Ohmic power **j**·**E**  $\frac{\partial u}{\partial t} = -\vec{\nabla} \cdot \vec{S} = -\vec{\nabla} \cdot \frac{1}{u_0} \left( \vec{E} \times \vec{B} \right) = \frac{1}{u_0} \left( \vec{B} \cdot \vec{\nabla} \times \vec{E} - \vec{E} \cdot \vec{\nabla} \times \vec{B} \right)$ Longitudinal modes carry no energy. Agranovitch & Ginzburg, Crystal Optics Stefan Zollner, February 2019, Optical Properties of Solids Lecture 4 20

#### **Lorentz Model for Oscillating Charges**

## **Lorentz Model (Dielectric Function)**

Peak of  $\varepsilon_2$  at  $\omega_0$ Broadening  $\gamma$ Amplitude  $\omega_p^2 = A \omega_0^2$ Dimensionless  $A = \varepsilon_s - \varepsilon_\infty$  $\varepsilon_2$  is never negative  $\varepsilon_1$  has a wiggle at  $\omega_0$ Longitudinal solution for

$$\omega_L = \sqrt{\omega_0^2 + \omega_P^2 - i\gamma} \approx 6.7 \text{ eV}$$

 $\epsilon_1$  negative from  $\omega_0$  to  $\omega_L$
